Description

Nanotechnology in Agricultural Practices: Prospects and Potential

N.G. Giri, N.S. Abbas, Saroj Kumar Shukla

The novel features of nano confined materials properties are widely explored in several agricultural practices i.e. seed coating, soil conditioning, preservatives and packaging of agro based products. The evolution of materials properties due to nano confinements like controlled degradability, solubility, responsiveness, gas barrier and porosity has added several suitable advantageous features in agriculture practices to help the farmers, traders, consumers and policy makers. In the context of the above development, the present chapter describes the basic features of nano materials to use in agricultural practices along with their impact and effectiveness. Further, the suitable scheme and illustration are used on the basis of available literatures to make the subject lucid and effective along with existing challenges.

ABSTRACT

The market has been dynamic for years. A local community shopkeeper, selling goods, was considered a business person. Days advanced and with the help of transportation facilities and the world community getting together, the market has expanded to a global village. The market remained dynamic and gradually marketplace has been replaced by market space. All the market tactics of retailing changed into e-retailing. The trade and business of the simple shopkeeper have turned into e-commerce. The market is still dynamic

Abstract

In this era, especially after facing the consequences of COVID-19, the digital world came up as a boom in society. Everyone is dependent on it for even small purposes, e.g., education, health care, shopping, counseling, and much more. In context to these fields, business intelligence plays a significant role in deciding the next move of any organization. Here it utilizes many machine learning algorithms to analyze the data set. This study provides the idea on the conduction of market campaigning depending upon the requirement of the products by customers. Data set is considered to be the asset of any firm. Many data scientists and practitioners scrutinize the data, maintain the correlation among collected data, and dispense out the decision-making policy. They also catch the outcome provided by all previous market campaigns as well. The proposed model shows the consumer's purchasing category, depicts the more accurate dependency, and further helps in improvising marketing campaigns to be conducted in future. **Keywords** Machine learning Business intelligence EDAMarket campaign

CHAPTER 3

THE WATER STRESS SITUATION
DURING COVID-19:
A MACRO-LEVEL STUDY OF AJMER CITY,
RAJASTHAN.

BHARAT RATNU¹ AND ANJANA RATNU²

Abstract: The fear of Covid-19 stopped the whole world, because of the non-availability of a vaccine and the spread throughout communities. The only way to stay safe in this phase was through healthy sanitation practices. In a developing country like India, the use of sanitizer is not affordable for a large sector of the population, and hence, people depend on the use of soap and water. Availability of adequate water and sanitation is a fundamental right, and a Sustainable Development Goal, but India is placed 13th among extremely water-stressed countries. Within India, Rajasthan stands 3rd in the ranks of water-stressed states, and with the pandemic, the demand for water increased, which, in turn, increased the gap between demand and supply. This study deals with the question of how demand for water has increased, and how the sources of supply during the ongoing coronavirus pandemic differ according to the income groups in the study area. It concludes that high-income groups, and most middle-income groups have somehow managed the increasing demand with the available resources, whereas the lower income groups depend solely on community hand-pumps, which not only puts them at risk of infection with coronavirus, but also has an effect on the economy. The study aims to discuss the importance of water harvesting as a sustainable practice in the region.

An Imperial 'Shrine' to Agrarian Research and Education

Decoding the Imperial Agricultural Research Institute, Pusa, in Bihar, 1905–36

Preeti

Bihar, an agrarian state in eastern India, is located on one of the world's most fertile alluvial plains, an area that is drained by the Ganges and its tributaries. However, colonial India in general – and colonial Bihar in particular – had a history of famine, reflecting poorly on British colonial administration. Recurring

The Chemistry of Friccohesity for Industrial Nanoformulations

Description

Author Bio

This book highlights the physicochemical properties which foundationally interface with chemical processes via the friccohesity chemistry of cohesive and adhesive forces for nanoformulations. It shows that cohad homogenizes and encapsulates structures with higher potential energy, and notes that friccohesity chemistry, via wavefunctions, overcomes the quantum energy barrier of thermodynamically and kinetically balanced nanoemulsions.

Effect of magnetic field on radially polarized laser induced electron acceleration in vacuum

Ravindra Singh, Ashok Kumar Shukla, Polly Biswas, Omwati Rana, Shiv Shankar Gaur, Amit Pratap Singh

+ Author & Article Information
AIP Conf. Proc. 2754, 100017 (2023)
<https://doi.org/10.1063/5.0161072>

Mathematical treatment of electron acceleration induced by radially polarized laser pulse in vacuum is presented. Effect of external magnetic field in electron energy is studied. The role of azimuthal magnetic field is found to be important which retain the electron energy only when the acceleration takes place. All the equations are solved by fourth order Runge-Kutta (RK-4) method. It is observed that the electron energy gain increases with the propagation distance in the presence of magnetic field of 5 MG. It is also observed that on increasing the laser intensity, the energy gain increases. For electron trajectory in x-z plane, the behavior of it is similar to a sinusoidal wave but not identical.

ABSTRACT

The chapter deals with the study of the propagation of cylindrical blast waves by using the quasi-similarity method in the polytropic dusty gas. The quasi-similarity method is the most useful tool to predict the flow pattern of the blast waves with moderate strength. It is addressed how dust particles affect the behaviour of
