

Transformation in Bacteria

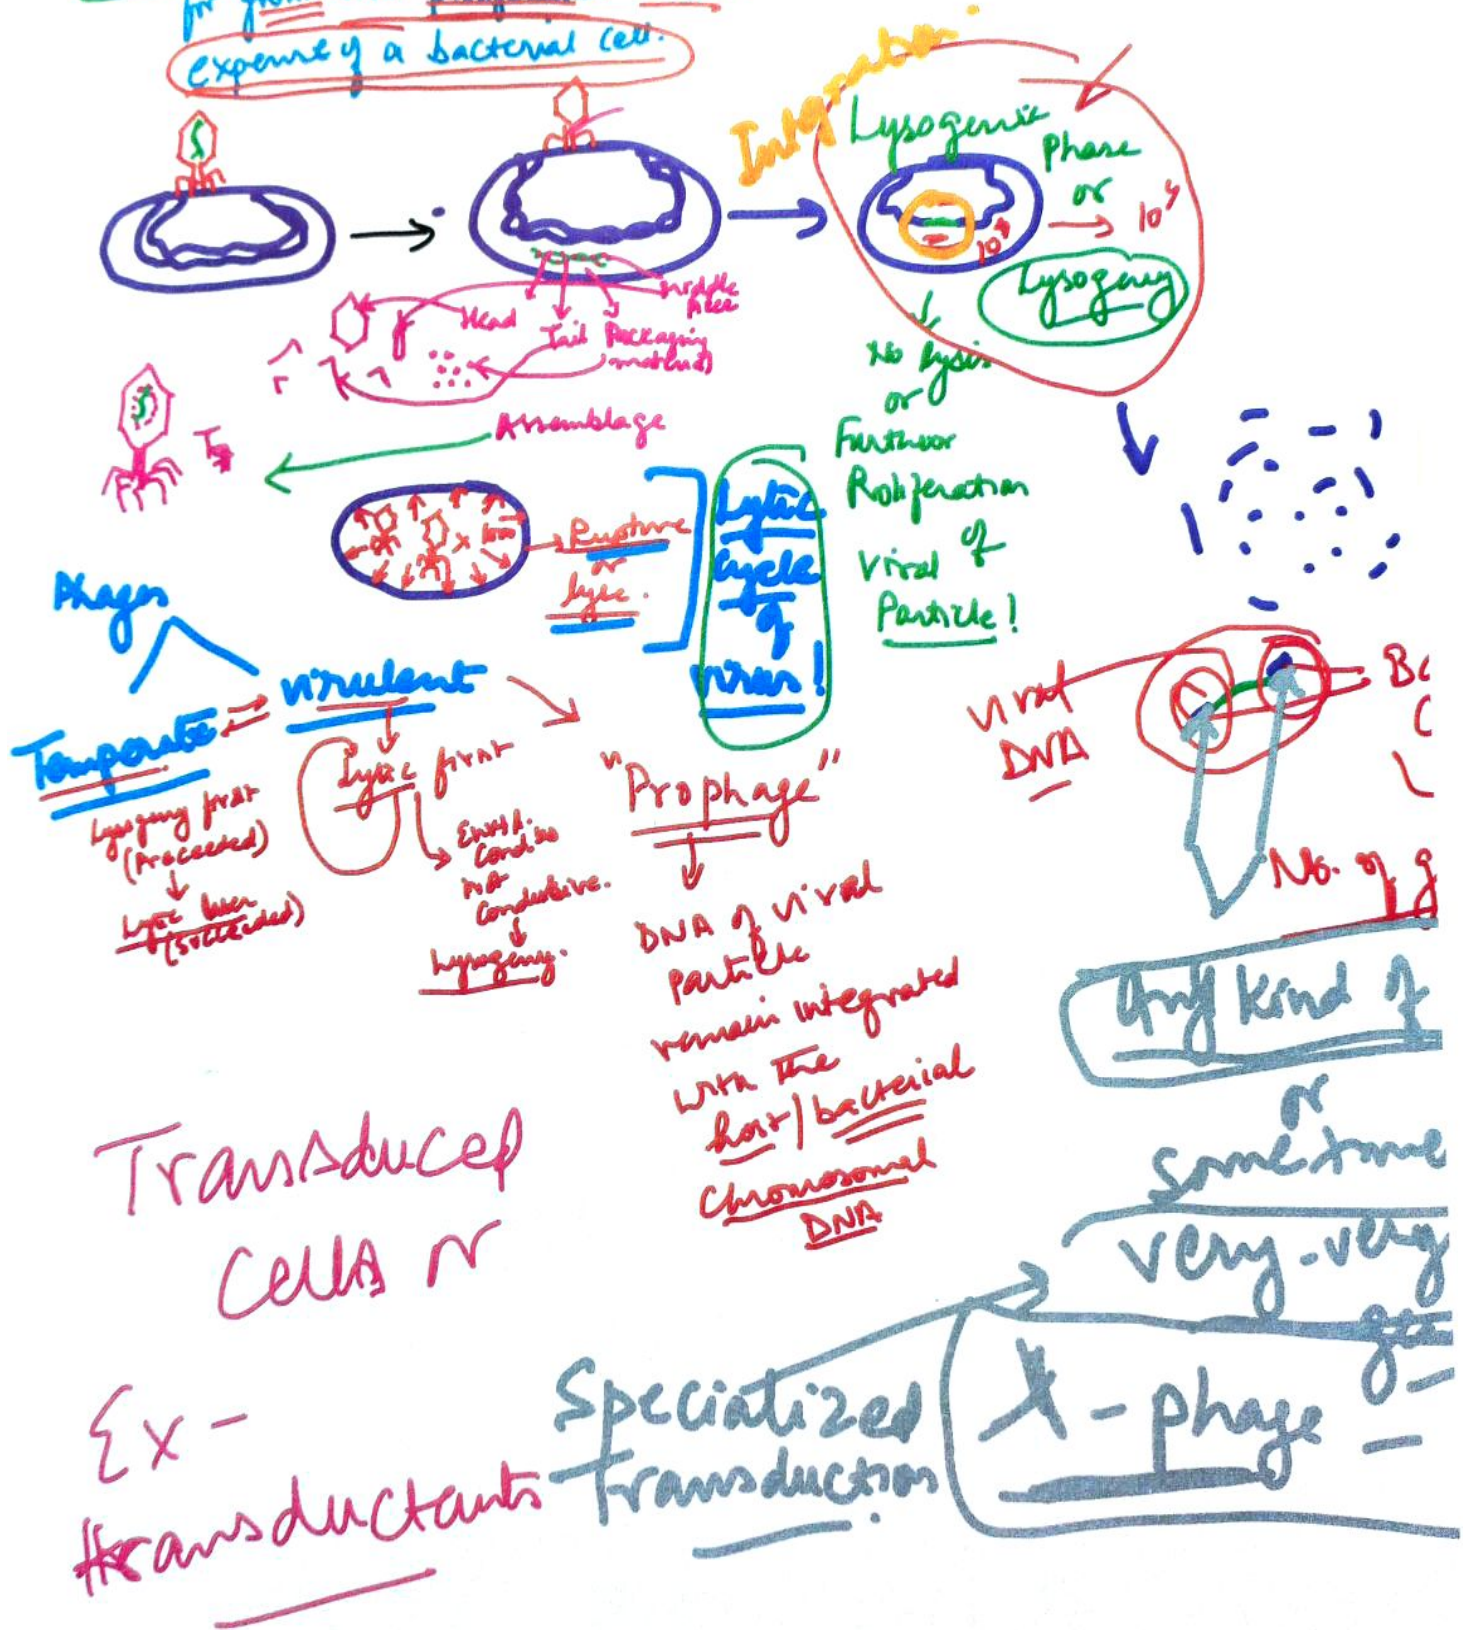

Tuesday, 6 October 2020 2:08 PM

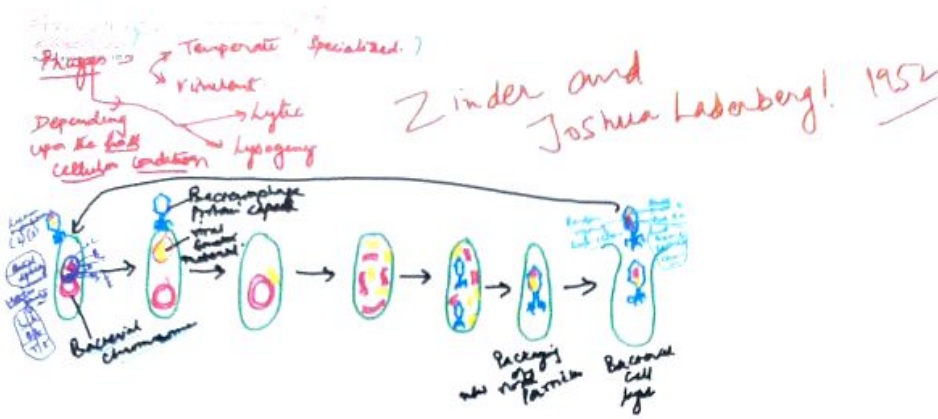

Co-Transformants
 All those "Genes" which are transformed together.

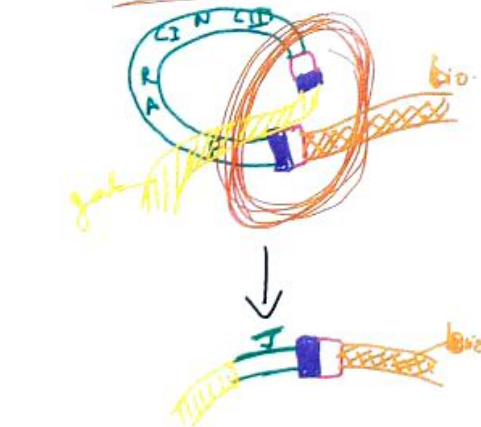

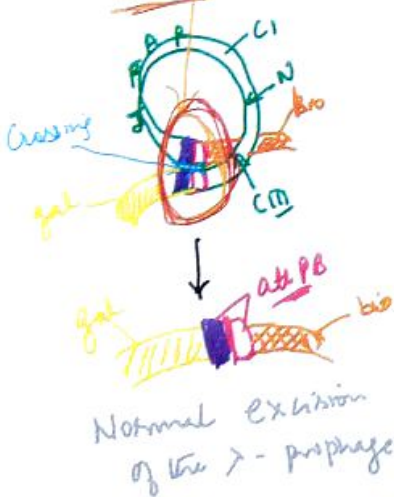

Bacteriophage → Obtaining nourishment for growth and proliferation at the expense of a bacterial cell.

Bacteriophage $\lambda \rightarrow$ E. coli

$\rightarrow$ Carries genes for gal (galactose utilization)
+ bio (Gene for biotin biosynthesis)

Variation in

is brought about in diff. bacterial cells by using / mediated by the viruses Bacteriophages!
